VIREO AUDIO

WEEKLY SUPPORT SLA REVIEW

To: Neha Kulkarni, Support Operations Manager
From: Vireo Support Intelligence project team
Subject: First-response SLA breach review
Period: 22–28 June 2026 · all agents, channels and teams · IST
Prepared: 29 September 2026 · historical export, not live performance

Executive summary

49 of 207 eligible tickets breached the first-response SLA (23.67%), representing ₹17,150 in estimated SLA-credit exposure. Chat had the largest channel breach count; Morning-rostered resolving agents were attributed 41 breaches. These are review priorities, not evidence of individual fault. Exposure comprises ₹15,750 for completed tickets and ₹1,400 for open/pending tickets; it is not confirmed credits paid.

What changed

Against the complete week of 15–21 June, the breach rate moved from **23.59% to 23.67% (+0.08 percentage points)**. Breaches increased from **46 to 49**, while tickets increased from **195 to 207**. The rate was broadly unchanged; the higher count should be read alongside the higher volume.

Where breaches are concentrated

Area	Tickets	Breaches	Breach rate
Chat channel	97	29	29.90%
Morning resolving-agent roster	109	41	37.61%
Logistics roster team	39	12	30.77%
Sai Sandhu · A3019	16	6	37.50%
Krishna Kaur · A3028	8	6	75.00%

Rows overlap and must not be added. The two agents tie for the highest breach count this week, but their small ticket populations make rates unsuitable as stand-alone performance judgments.

Operational observation

34 of the 49 breaches (69.39%) arrived during Night hours and were attributed to Morning-rostered resolving agents. Overnight queue carryover is worth investigating. Arrival time and resolving-agent attribution are different: this pattern does not establish attendance, staffing causation or individual responsibility.

What to investigate next

- Review overnight queue handoffs and the 34 Night-arriving, Morning-attributed breaches; obtain queue and attendance records before drawing coverage conclusions.
- Inspect chat delays and Logistics routing with the relevant leads; review the two agents' actual cases before individual conversations.
- Track weekly progress against a **proposed 15% operating target—analyst-selected, not client-provided**. Review routing and handoffs within existing staffing; headcount is frozen until Q4.

Evidence

TK-254054, TK-254053 and TK-254051 are real breached tickets from this week that arrived at Night and map to Morning-rostered resolving agents. Inspect their timing and case history in the app; these examples support the observed pattern, not a proven cause.

Data note

Figures use the supplied export, Vireo's policy effective 1 April 2025, IST reporting dates, duplicate removal and historical roster assignments at ticket creation. No earlier policy or credit ledger was supplied. This memo uses calculated facts; queue carryover is an investigation hypothesis. AI accuracy has not yet been measured against a human-labeled benchmark.
